

Business Online Digital Security Tokens

You can now set up a digital security token on your smartphone to access Business Online.

Download the App

Huntington's digital security token process allows you to use any smartphone authentication app you prefer. The most commonly used **authenticator applications** include:

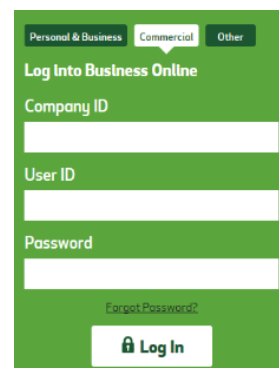

- Google Authenticator
- Authy
- Duo
- LastPass
- Microsoft Authenticator
- Protectimus

Your Business Online administrator will need to assign the Digital Token on the User Profile screen prior to being able to use it.* To get started, go to the Google Play® or App Store®, depending on the type of smartphone you will be using. Select and download the app the best fits your company's needs before logging in to Business Online.

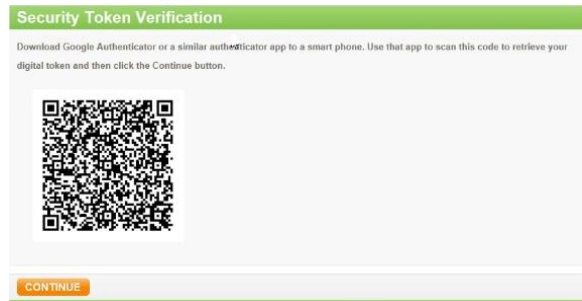

Connect your Authenticator App with BOL

1. Go to huntington.com, select the Login tab and then Commercial. Enter your credentials and click Log In:

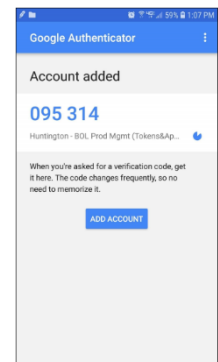

- **Company ID**
- **User ID**
- **Password**

2. After logging in to **Business Online**, you will see a screen with a QR (Quick Response) code. This is a type of barcode containing a user-specific matrix of dots.

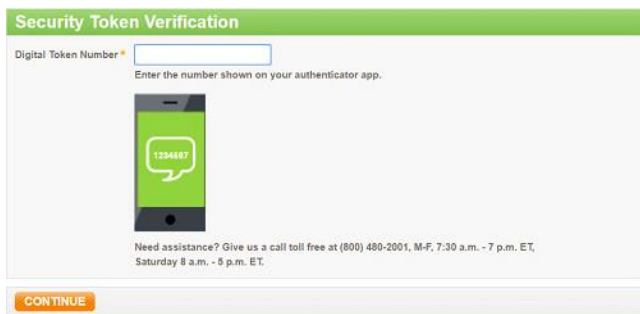

3. Open your smartphone **authenticator app** and follow the setup instructions. When prompted to use your phone to take a picture of the QR code on the BOL screen, be sure to line up the QR code (dot matrix square) within the frame of your smartphone camera.
 - Once your digital security token has been established, the **authenticator app** on your smartphone will provide a confirmation and you will see a Digital Token Number field.

4. Click the **Continue** button on the **Business Online** Security Token Verification screen.

5. On the next **Business Online** screen, enter the code from your smartphone **authenticator app** in the Digital Token Number field and click Continue. This completes the Digital Token set up process.

6. You should now have access to **Business Online**. You will need to enter a Digital Token Number every time you log in to **Business Online**.

As a reminder, the Digital Token Number changes every XX seconds, so it cannot be saved or stored. Additionally, every user who accesses **Business Online** with a digital token will need to download an **authenticator app**.

**Please ensure all required fields on the User's Profile are complete prior to assigning the Digital Token.*
